

What's New in ZPrint 7.6

Changes from ZPrint 7.5.27 to ZPrint 7.6 include:

- 1) Link between ZPrint and ZEdit Pro
- 2) New Witness Part Generator
- 3) Several bug fixes and minor improvements

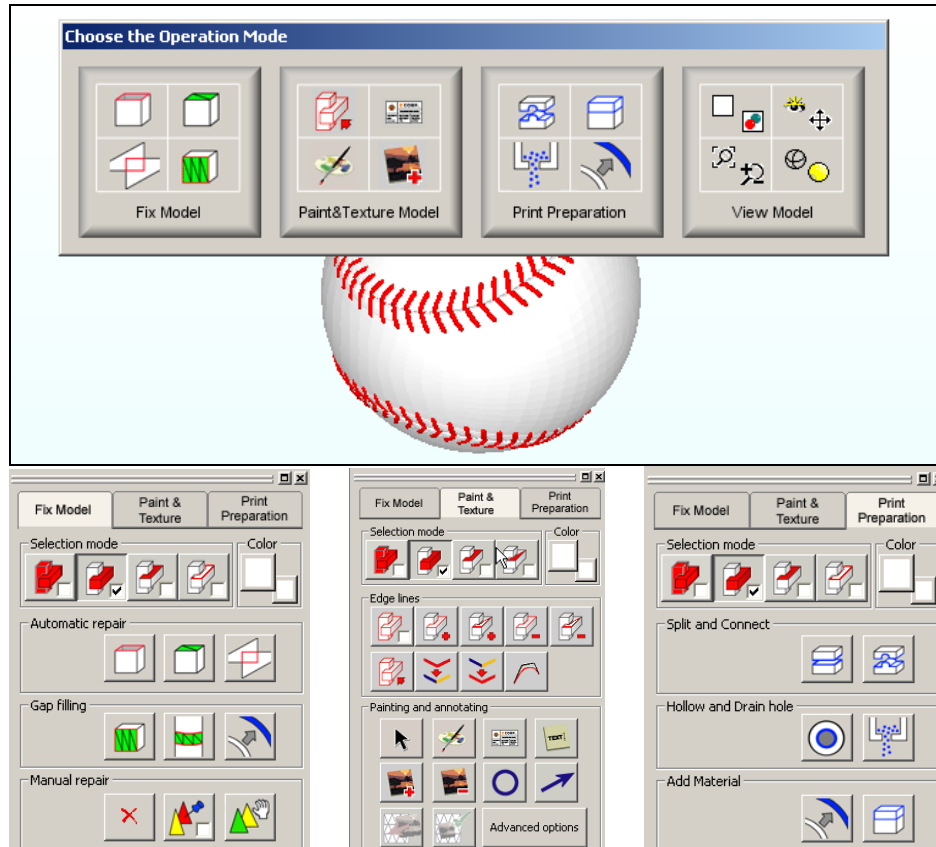

Connecting to ZEdit Pro

The primary change for ZPrint 7.6 is that it adds a link directly from ZPrint to the ZEdit Pro program. The toolbar in ZPrint now contains a new icon next to the link to ZEdit:

ZEdit contains a basic set of painting and texture mapping tools that are included with every seat of ZPrint. ZEdit Pro is an advanced program from ZCorp that expands that functionality to include tools for fixing and preparing files for printing. This optional program is available to help streamline your data preparation workflow and optimized for use with Z Corporation 3D Printers.

ZEdit Pro Menu Structure

Adding a Witness Part

A witness block is a valuable tool to help deliver even color across a model. Using a witness block will prime the print heads before the print heads reach the model. Please refer to the Color Quality Best Practices document on the User website for more information about when to use this tool and other best practices for making great color parts.

“Make Witness Part” will automatically generate a solid witness part in front of the part. This witness part does not touch the part, but is in close proximity for uniform printing. In the example below, the grey part in front of the car is the witness part.
